

ABSTRACT OF THE DISCLOSURE

A mask pad for a mask for a breathing device for treating a patient includes a side wall to connect to a mask shell of the mask and a sealing lip to sealingly engage with a patient. The sealing lip extends from the side wall, wherein the mask pad has a varying Shore hardness through its cross section, and at least a first region of the mask pad having a higher Shore hardness than other regions of the mask pad. The first region is proximal the mask shell when the mask pad is connected to the mask.
